

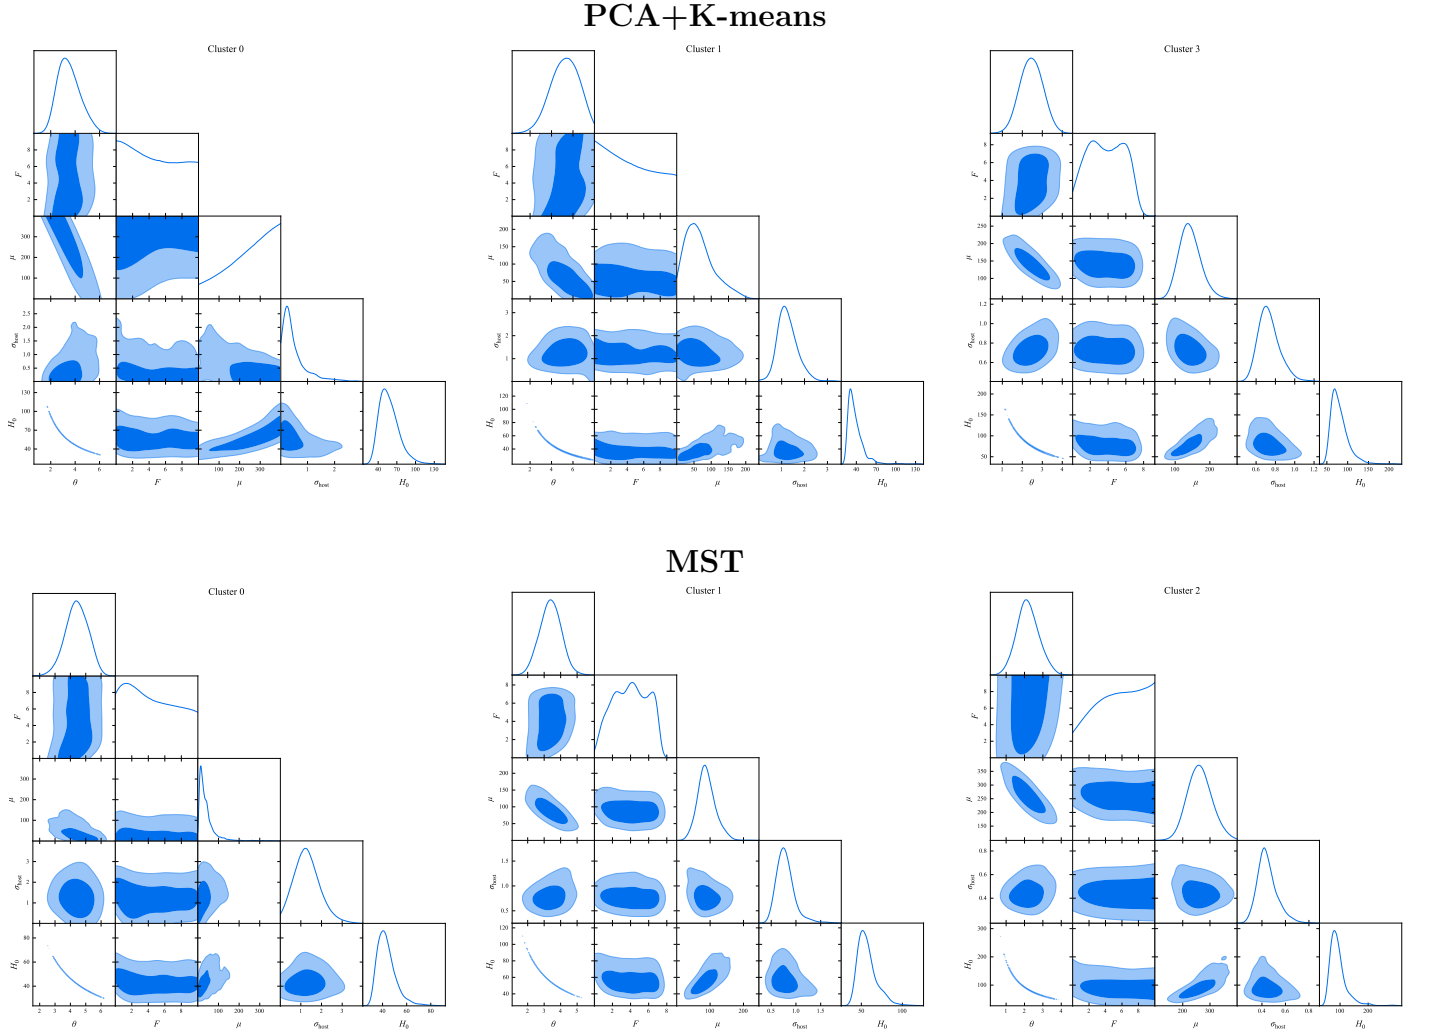

Figure 1: Marginalized one-dimensional posterior distributions and two-dimensional credible contours for the fiducial six-feature clustering analysis. The upper row shows the statistically usable PCA+K-means clusters, and the lower row shows the statistically usable MST clusters. The contours correspond to the 68% and 95% credible regions. The parameters shown are θ , F , μ , σ_{host} , and the derived Hubble constant H_0 .

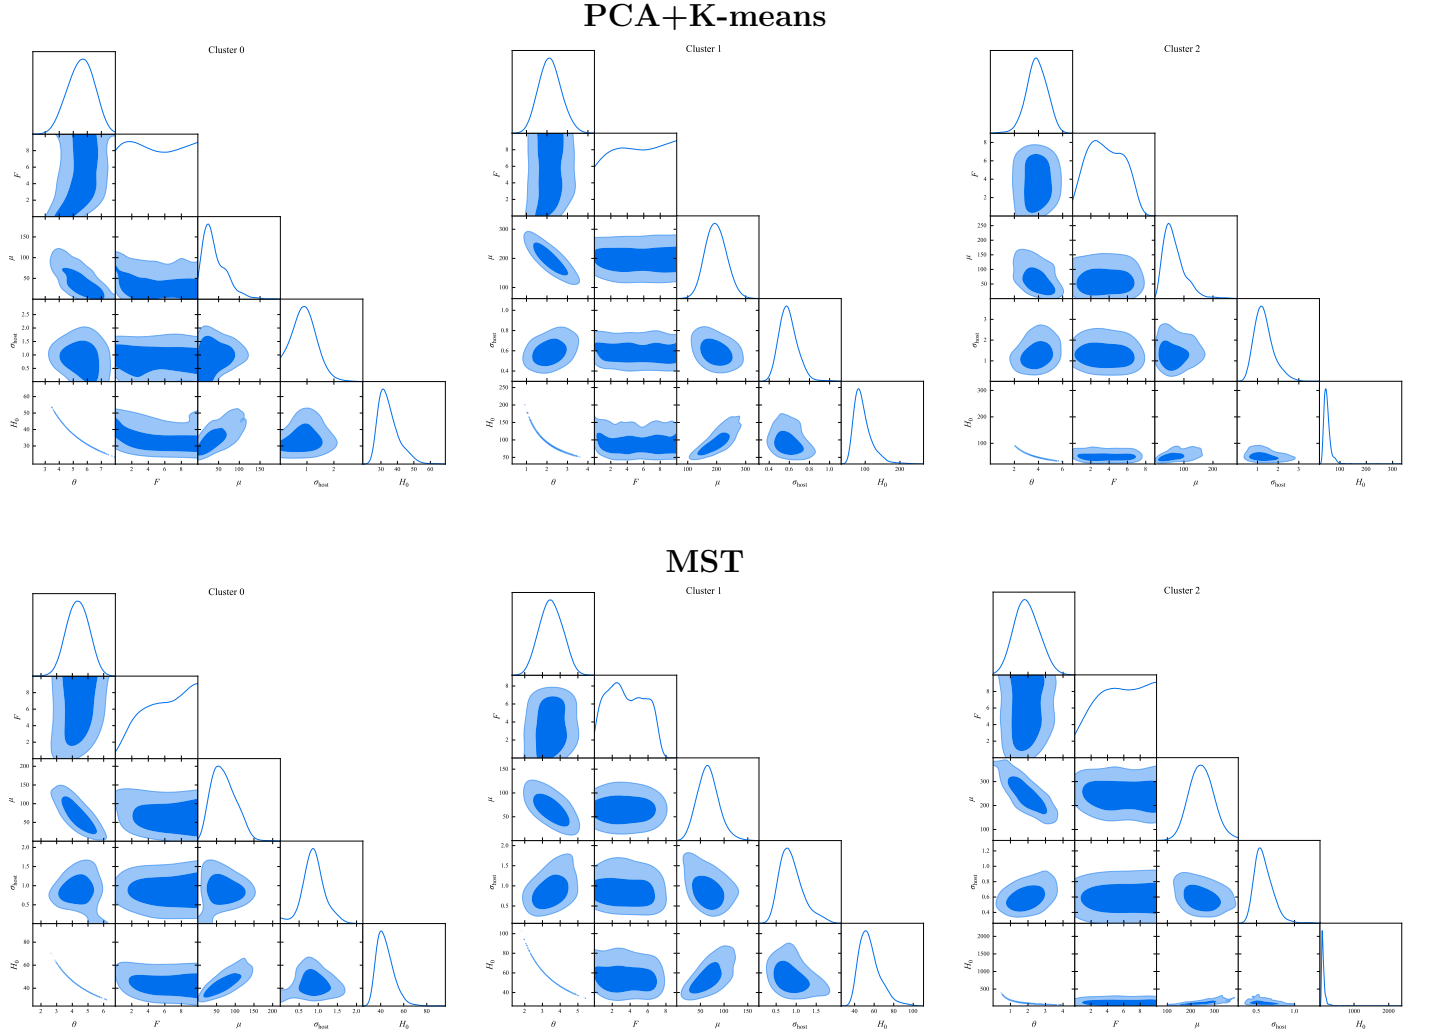

Figure 2: Marginalized one-dimensional posterior distributions and two-dimensional credible contours for the control analysis using only the directly observed flux and fluence. The upper row shows the PCA+K-means clusters, and the lower row shows the statistically usable MST clusters. The contours correspond to the 68% and 95% credible regions. The parameters shown are θ , F , μ , σ_{host} , and the derived Hubble constant H_0 .
